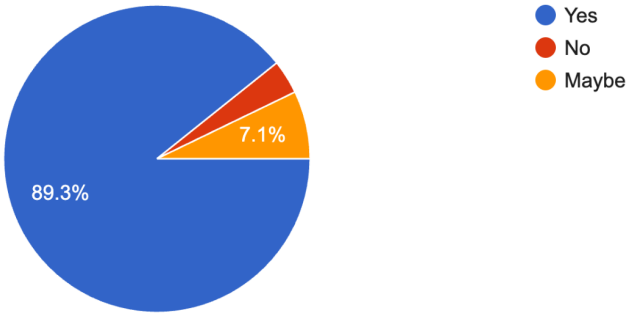
Employer and Student Survey
Internship-for-Credit Summer 2022
Key Results

Student Responses

A. Would you Recommend this Employer to Other Students

1) Would you recommend this internship provider to another student?
28 responses



B. Positive or Negative Experiences

- The overall internship experience was good. And I feel that I learned a lot in terms of real world experience. But I felt the manager could have been better prepared to have interns trained. I also think he could have been better at communicating. It seems as though he avoiding confrontation.
- Overall a positive experience for me. I really enjoyed the work environment, my coworkers, and I learned a lot. I'm definitely a better programmer after having completed the internship.
- Very good learning experience with hands-on projects; negatives would be that sometimes the work environment is slow and there is long wait times in securing materials
- Felt like a real job as a software engineer. I felt fully integrated as a part of the team and was given cool projects to work on. I had no negative experience.
- Free lunch every day, got to work on a real product, learned a lot about UI development
- They made sure I was growing and doing the things that I wanted to do
- They were the best managers ever!
- Mark was a great manager/supervisor during my time at the company. He made sure to do bi-weekly checkins to make sure I was on the right track. He also gave great advice throughout the program in order to help me improve and pointed me to helpful resources

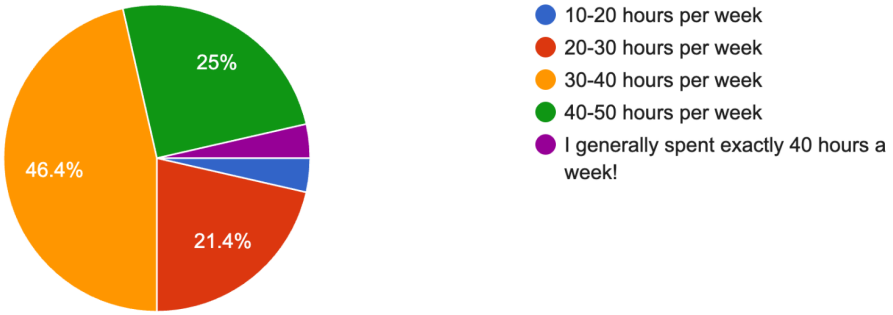
- Greg, our supervisor, is incredibly knowledgeable and recently helped me think through a complicated flattened tree custom data structure that we were building for Learning Suite. Because of his help I was able to conceptualize it a lot better and code it up.
- The internship was awesome. They put you into a real life work scenario and treat you as another member of the team.
- The internship provider allowed me to take time to learn and understand the technologies used (e.g., TypeScript, AWS, etc.) which made me feel more comfortable. A negative experience was the difficulty I experienced when trying to contact my supervisor directly.
- All positive experiences for me. I was given a lot of room to grow and learn about the field I'm interested in.
- Great experience! I learned so much about real world development.
- SimpleNexus has a robust and well structured internship program. They treat their interns like full time employees and it is their goal to bring every intern on full time.
- My overall experience was positive, with the highlight being the fact my team integrated me as a full-time software engineer and not simply an intern. I was able to work in the same tasks that other engineers were working as well.
- Podium was an incredible company to work for. I learned a lot, got a large amount of mentorship, and increased my skills more than I ever thought possible! Podium also did several special events for interns where we had the opportunity to meet with the C-Suite executives! I absolutely loved this experience.
- I thought overall the experience was very good. I felt that my voice was heard and respected throughout the internship.
- I was able to work on many big projects that will be used to help improve my own learning experience.
- Probably not the best training for a new intern coming in but I learned a lot during the experience.
- Great experience. Super stream lined where necessary, but also allowed for flexibility and growth
- I had the opportunity to do my work from home and still learn a lot. I also liked how I had a project just for me that I programmed front and back end for and I really enjoyed that. Sometimes it was hard to get ahold of people in different time zones but that's the only hard thing.
- The internship surpassed all my expectations! It was an amazing experience
- I did get to work on a meaningful project and learned a lot, which I loved. The only reason I say "maybe" is because I spent a lot of time waiting around for other people to do their parts.

If I bugged them about it, they rarely had urgency in their actions, perhaps because they saw me only as an intern.

- Love the environment, people, opportunities, trust, and mentors.
- Positive:
    - - Flexible hours: able to take classes and make up hours later
    - - Flexible workplace/ Hybrid work environment: able to work remotely or in office whenever I want
    - - Unlimited PTO: able to take time off for my health and for family events
    - - Applied practices and principles learned from CS courses in work and vice versa
    - - Productive 1:1's with my supervisor where feedback was provided both ways
    - - Gained experience beyond the scope of a software engineer's job description
    - Negative:
    - - Sometimes, I wished there were better processes in place for bugs
    - - When working with people in non-technical positions, sometimes communication was not clear or was vague
- They were very understanding when personal problems came up and we're good to work with.
- The culture is absolutely amazing. There will usually always be people difficult to work with anywhere you go, but on the team I was on, I couldn't find any! They were such amazing mentors and teachers, and I can't thank them enough.
- It was an extremely positive experience! Everyone was nice, there was plenty of opportunities to learn, the pay was great, and they were easy to work with. I feel like I had the best internship experience I could hope for as far as mentorship and opportunities go. The onboarding process was thorough, management was very helpful, and there were many intern-only activities that facilitated relationship building. The internship was incredible.

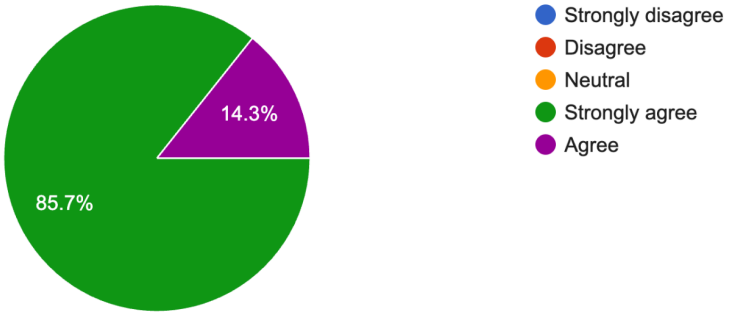
C. Hours Worked per Week

2) How many hours did you spend per week during your time as an intern?
28 responses



D. My internship allowed me to take initiative in my own learning and apply practical experience in a computer science career field

3) My internship allowed me to take initiative in my own learning and apply practical experience in a computer science career field.
28 responses



- I was thrown into the deep end of programming as part of a team at a corporation. I was forced to take personal initiatives in my own learning. Otherwise I wouldn't have learned anything and it would have been a waste of time for me.
- There were many times when I ran into problems and I had to try and figure them out on my own. This definitely boosted my abilities in computer science because it basically forced me to grow.
- Projects are self-guided and enabled me to use tools that I wouldn’t otherwise use in a classroom setting.
- I was working on real life projects that were being pushed into the app. It was very practical and helped me learn.

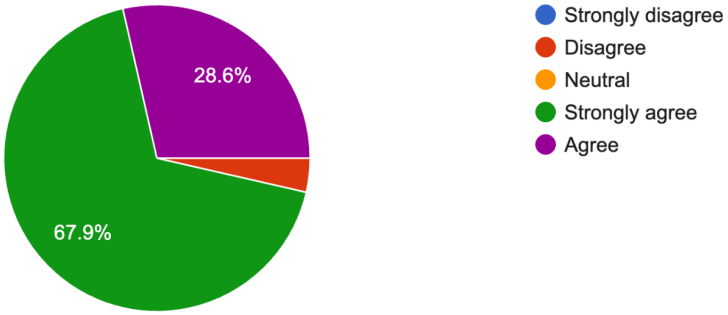
- The internship is fast-paced and very technical. I grew so much in my ability to code and test software.
- If I found things to work on, they would let me do those. Also, there were meetings where they emphasized giving me the best experience possible as an intern
- We had a ton of free resources on almost all topics so we could learn whatever we wanted for free
- I was able to contribute to the company's codebase and go through the full process from development to deployment and production. I was given many opportunities to showcase my work and interact with other engineers to get code reviews and feedback.
- It was an amazing opportunity where we could take some of the initiative in writing the code and thinking through the logic, but where we also helped each other stay on track with good design patterns and watch out for flaws in our logic.
- I feel like I really learned what it meant to be a software engineer and had to apply lots of concepts from school.
- I was able to take time to complete tutorials and complete practice problems that allowed me to learn and experiment on my own.
- I was given a lot of resources to learn and space to apply it.
- I was able to apply many of the things I learned from my computer science courses, but I didn't get to pick the tasks I worked on. I got to learn, but only the things needed for each task. This was still lots of new information for me though.
- During my internship I was expected to produce valuable work, the same as any other full time employee. This was a lot of responsibility but was also the best way to prepare me for a career in computer science.
- I owned 100% of each task I was assigned to work. From writing its specifications, up to writing its acceptance test cases. I always had reasonable time to finish each task, I could reach out to our tech lead as needed, and I had autonomy to use my time for learning when necessary.
- I had the opportunity to do a lot of self guided learning, but I was also able to shadow some incredible senior engineers as well! I did the job of a normal team member, and learned some incredible skills.
- I had a lot of opportunities to take the lead on projects
- Throughout all the projects I was in, I would always try and learn how to fix problems before I asked for help. Most of the time, I could do it without help from others.

- I was very independent in my position. I would be given a task with a quick over of what needed to be done with question I had, and then they would pretty much leave it up to me to figure it out. I appreciated the time they would go over my code with me and point out things I could improve and why.
- I was able to use all the knowledge from school I could muster to complete an intern project
- I was able to do a whole project on my own allowing me to apply what I knew and they gave me time when I needed to learn something new which I really appreciated.
- I was given my own project and I set up my objectives and check points. I received help, but they expected me to speak up when I got stuck so I could get the help I needed. This allowed me to work out my problems in my own time but still have help available
- I was left to figure out a lot on my own, which at times was good because once I made it past the initial struggle, I understood it very well. I got to work on a POC for modernizing some of Fidelity's legacy infrastructure, which was very practical experience. I was exposed to a lot of modern technologies and cloud concepts along with my programming.
- I was given ownership of projects to learn and do what I thought was best which allowed for learning and exploring on my own as well as mentoring from others.
- I was given tasks and had the liberty to go about each one with how I saw fit. In addition to this, I was delegated as responsible for certain projects and was able to learn and gain experience with breaking down projects and delegating and leading. I always was given the liberty to say yes or no to tasks too!
- They gave me experience working with a team and learning how to collaborate with multiple programmers but I was also able to suggest I learn new skips or work on certain problems I found
- I was an equal member of the team. I wasn't given some random internship assignment, but rather took part in the work like everyone else.
- During the internship, I was presented with a problem and proposal for an application that would fill that need. Then I had complete ownership of the project, including planning the details, designing everything, and carrying it out. I used many of the skills and things I learned from BYU in my work, and gained meaningful experience with many concepts and technologies. I built a full stack application, so I gained practical experience with design, backend work, frontend work, and deploying the project on AWS. It was great practical experience.

E. Overall, I would say that my educational goals and expectations were met

4) Overall, I would say that my educational goals and expectations were met.

28 responses



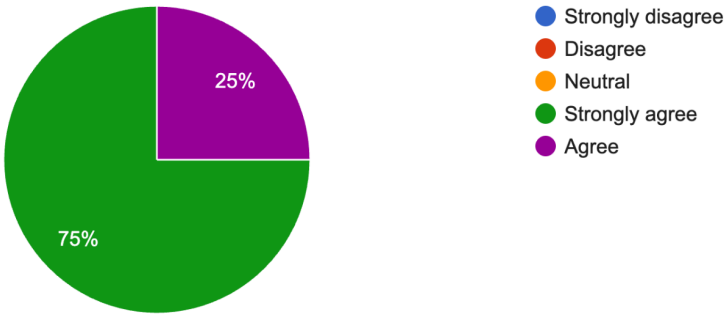
- I feel that my goals and expectations were not met. I expected to learn more than I did at my internship in terms of pure programming knowledge and experience. With the way the internship program at Security Metrics was set up, I feel that it just wasn't the case. I speak on it in my reports.
- I knew exactly what to expect upon starting. I had the goal to learn as much as I could while there, and I feel as though I learned a lot. This definitely helped me to be a better student as well. I'll be able to employ many of the principles and practices I learned there as I finish my schooling.
- I learned a lot from my internship; I will be much more confident now going into classes again.
- My expectations were exceeded. I learned more than I thought and I loved my time there.
- I was hoping to gain real world experience, and I learned far more than I had expected to.
- I learned react and many other softwares that I didn't know previously.
- I think it was a great overall coding experience with scrum teams and coding principles
- I was able to learn very commonly used frameworks and libraries that will be useful when I work at other companies. I also felt that I have a better understanding of what it means to be a programmer and learned important practices that helped me be a better team member.
- This internship helped me learn more about good coding practices and helped me keep up on my coding skills.
- I learned a ton about actual practical computer science knowledge and felt like it really helped me prepare for my final year of school. I now know what I want to get out of my last couple semesters.

- I was able to learn so much about TypeScript, Vue, AWS and some much more! I didn't get as much pair programming as I would have hoped.
- I learned more than I expected to learn.
- I wanted to experience real back end development to know if it was what I wanted to pursue as a career. I got this experience and I have a better idea now.
- I have learned so much about both what I want and don’t want for my future career in software engineering. SimpleNexus has wonderful mentors that have taught me so much about coding practices and what to expect as a full time software engineer.
- I had my expectations and goals met, but not my original ones. When I started this internship I expected that I would be working on a focused project and spend most of time writing features. Instead, I was integrated as part of the engineering team working on the same task that other engineers were working on. This exposed me to other aspects of software development that I didn't think I wanted to get exposed to, but I can't say that my internship was spent mostly coding as I originally have intended.
- I learned more than I ever thought possible! My team was incredible, and I learned a lot of very applicable skills.
- I get that a little more mentorship could have been good.
- I was able to be a developer all summer and get valuable work experience working on real projects.
- I feel ready to work as a professional developer after graduation now.
- It was exactly what I hoped for- experience working in softare engineering. Exposure to the process at all levels
- I loved how much I learned here. I learned about things I never thought I would and was constantly looking things up to learn about it.
- I had the opportunity to learn and understand what working in the field will actually be like. I was able to grow in my ability to collaborate with a team, work on another's code, and to take own a large project.
- I learned much more than I expected to in some areas of my internship, but felt that I could've been taught more in others. For instance, I learned an incredible amount about devops and cloud computing, which I didn't expect at all. However, I was just assigned 1 project and didn't really get to experience the full flow of a real software engineer who would work on multiple tickets/cases at a time.

- I've learned a lot about work environments and working in teams and working with the software lifecycle. I feel like I'm far more confident now in my development ability than ever before.
- Definitely! I was able to not only apply what I have learned so far from my CS courses in my work and be able to understand certain technical discussions, but I was also able to acquire a lot of new experience and knowledge with everything I worked on and was assigned. I was expecting to be edified and I certainly was on a daily basis. I also have grown to be okay with not knowing everything.
- I was hoping to learn more about what my career would look like and this job gave me a really good idea of that
- I expected to learn a lot about programming from professionals and what the lifestyle entails, and I did.
- The internship gave me a ton of experience applying the things I had learned in school and gave me experience with high demand skills. This is what I hoped to gain from it, so I was very well pleased. My educational goals revolve around being prepared to be a software engineer, so everything I did helped me with that central goal. I felt as though I could make the internship into what I wanted, and I did so.

F. Overall, I would say that I have a positive experience of my internship

5) Overall, I would say that I have a positive experience of my internship.
28 responses



- I think the experience was positive overall. I didn't hate it. I enjoyed a lot of my time there mainly because of my coworkers. I do not regret taking this internship, because it taught me about the dynamic of a workplace. And I can now beef up my resume with it.
- I worked as a web developer, so that involved me learning a lot of the web technologies like PHP, Vue, HTML, CSS, and JavaScript. I was able to work on multiple projects, like the

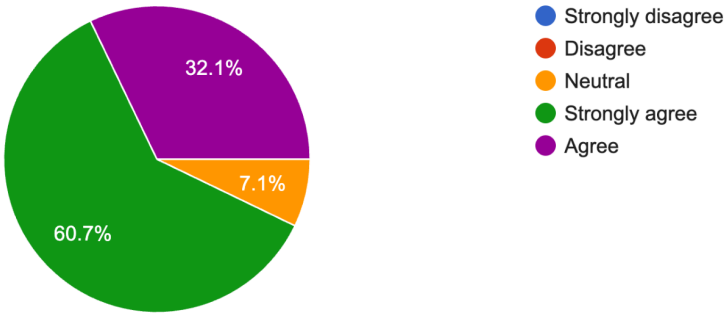
assignments page and the rubrics page, during this time. I also was able to work with other coworkers, and I learned the importance of working as a team towards a common goal.

- This was my first internship so it allowed me to experience a professional coding environment and how I will interact with others. I learned about Agile scrum development as well.
- As a full time software engineer intern this summer, my opinions were valued and I felt like I belonged there. I loved to be at a big tech company learning about every side of the corporate structure. I liked being around not only engineers, but sales reps and designers and product managers.
- I liked my team and the people I worked with
- It was a 10 week internship in LA with AT&T and participated on 2 scrum teams and 2 projects
- I was surrounded by a lot of other students who were also working on Learning Suite so we were able to form close bonds and became good friends.
- My internship was an incredible experience for me. It really helped me grow and learn. I felt like it helped prepare me for the real world.
- In my internship, I was able to work on and lead a project the contained work on both a backend and frontend service. This was a great experience as it allowed me to develop and refine skills in both areas.
- I worked with a lot of smart people, all of whom were kind and willing to work with me to help me learn!
- Pattern was very kind to ask its interns this summer. They gave us good opportunities to work on real projects.
- Throughout my internship I felt cared for as an individual. I was given all the support and opportunities needed to be successful at my work.
- Even though my original expectations were not met, my team was supportive in helping me adjust to the reality of my own internship. They allowed me to expand my vision in terms of what I could gain from the experience, and helped me to set new goals according to it.
- I met incredible people, learned a ton, and had a great time. I could not have asked for anything more from an internship. My team treated me like one of their own, and did not just assign me dead-end projects. I actually felt like I was able to contribute and make a difference on the team!
- I thought the experience was great, and I had the opportunity to really stretch my knowledge and learn. I also was put on a new team, so there was a lot of opportunities for responsibility.

- The CTL is a wonderful place to work out with great senior developers and coworkers.
- I would say that I got the full experience of what it’s like working for a start up. I would love to see what it’s like working for a larger company in the future but it was a great experience overall.
- It was a great experience. I feel more confident in my skill and ability to succeed in industry
- I worked for different members of the team until I was assigned a coding project in which I made a dashboard for internal use. I really enjoyed working with everyone and since it was a startup I felt needed and I really enjoyed my experience.
- I enjoyed everyday. I felt like I was a part of the team. I learned more than I realized and I am excited at the idea of coming back and working for Qualtrics again.
- As I've been saying, despite some things that I felt could've been better (help from co workers, a few learning experiences), I had a very positive experience with Fidelity. I got to work on a meaningful project that provides the company great business value, and learned a lot in the process.
- I did front end web development and was given real meaningful projects to work on. I felt like I was valued and given opportunities to contribute in every meaningful way. I learned a lot and was given very kind guidance when I wanted and needed it.
- I was always encouraged to grow and take on tasks that were either new or familiar to me. In addition, I learned about the value of clear communication and expectations as well. My supervisor was also always willing to help and mentor me, which I find made me grow exponentially. Overall, I feel like my growth and my happiness as an employee was prioritized and because of that I thrived. The internship was fulfilling, edifying, and a great place for growth.
- We’ll this was already covered in both my papers but I worked full time in person on a variety of front end applications.
- I loved the internship. Unfortunately, I didn't really enjoy the job itself. I just don’t think software is for me, but I had a very positive experience at FamilySearch.
- I had a very positive time at Apple. I was well taken care of. The compensation was generous, and potential headaches such as housing were all taken care of for me. I was provided a support structure with a manager, technical mentor, and an assigned buddy who helped me navigate the culture of Apple. My team was great, the work was enjoyable, and I learned a lot. I owned a project and carried it out to completion, and at the end of the internship gave a presentation to some upper level management, All of this was valuable experience for me. I feel much more prepared to work as a software engineer after the work I did during the Summer, and hope to receive a return offer.

G. *The internship provider or internship supervisor provided mentoring opportunities in facilitating my understanding of departmental expectations for my professional performance*

6) The internship provider or internship supervisor provided mentoring opportunities in facilitating my understanding of departmental expectations for my professional performance.
28 responses



- I feel that the supervisor did not provide any serious mentoring opportunities. He did lay out his expectations for me and told me where I could improve. But I feel as though it was the lowest priority for him on the list of things to do.
- I always knew what was expected of me, so I always tried to do my best. Working on developing Learning Suite was particularly interesting because it was something I myself had experience using. My supervisor created an environment where I could succeed, and I always knew what was required of me.
- Many workshops were offered throughout my internship that allowed me to learn new skills and programs.
- I was given many opportunities to speak with mentors and use them to help me solve problems and learn new things. I felt that I did not take full advantage of this opportunity and wish I could've used it more.
- This company assigns you a functional manager to ensure you understand your day-to-day responsibilities, and a talent manager to help be a mentor and advocate for you across the company.
- I had a designated mentor plus more people who I could ask any questions to make sure that I was learning as much as I was asking
- My mentor for the summer actively asked me to think about my future and my development as an engineer

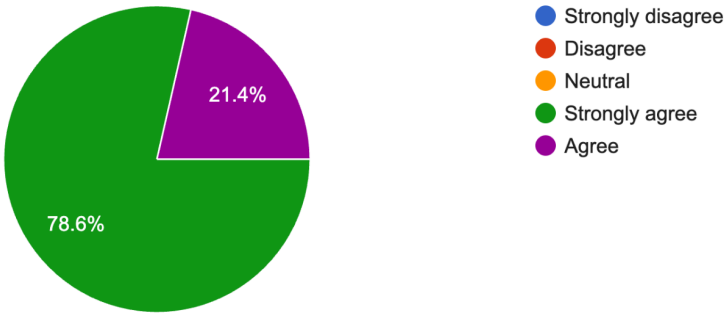
- Everytime I would have meetings with him, we would always discuss what he expected out of these projects and made sure I understood exactly what I was doing. If I needed help with anything, he always made sure to make time to help and explain any uncertanties.
- Our supervisor Greg had weekly meetings with the team and helped review our merge requests where he was able to mentor us and help us grow as computer programmers.
- I felt like there was a clear set of expectations for me during my internship. I was expected to work hard and contribute to the team.
- There were many times that I needed my supervisor but they were unavailable; however, when they were available, I was able to get the help I needed.
- In this workspace I got more exposure to what jobs in the CS field can be like.
- I had a sort of mentor, but he was often very busy, so I didn't get to ask as many questions as I would've liked to.
- I was assigned an experienced mentor to both show me the ropes of SimpleNexus and also answer any general questions I had about a career in computer science.
- I had recurring one-on-one meetings with my engineering manager. On these meetings I received direct mentorship from him on subjects about best engineering practices, career development, and how I can succeed as an intern.
- At the beginning there was not a very structured approach to onboarding, but once I got in the groove, getting feedback and talking to superiors was very easy. Everybody was incredibly accessible!
- There was a lot of mentorship during the internship, but I feel that there would not be very many experienced engineers post-graduation. The mentoring tapered off at the end.
- On some of the project I was doin I needed specific guidance on how to optimize the page. It was nice to see how a senior developer approaches those problems.
- I felt like I was able to receive a large amount of mentoring during the entire internship.
- They assigned me a mentor whom I worked with closely. He answered questions and guided my design
- Yes I feel as if they not only showed me how to work in a professional setting and what expectations are in that setting, but they also shared their experience with me and helped guide me in making choices.
- My mentor was amazing! Camille made sure I had something to work on and encouraged me to continue to learn and experiment with new ideas

- My manager was wonderful about providing me all of the necessary resources to be successful during my internship (even if some of those resources were people who didn't help as much as I would've liked).
- Code reviews were very helpful as well as an encouraged environment to talk to other people when we get stuck or need help. Everyone is very kind and willing to help each other.
- We have weekly 1:1's where we check in with each other. It is during these meetings that I felt mentored and guided with feedback. In addition to these meetings, all of my questions, concerns, feedback, and ideas were always acknowledged and talked through.
- I often met with them one on one and received group trainings
- My team was naturally mentoring. They constantly stopped to explain things for me, which was extremely helpful.
- I was assigned a technical mentor from the first day I arrived at my internship. My mentor guided me throughout my project, giving advice and help as I went along. He ensured that I wouldn't get stuck for too long, and gave assistance for the blockers I would encounter once in a while. The expectations for me were made clear from the beginning, and I was also able to meet weekly with my manager to talk about what I had done and review things. I felt well mentored. I was given the flexibility to build and learn things on my own, but was given the support I needed to stay effective.

H. I see strong leadership support of the internship provider's value of diversity and inclusion. People of all cultures and backgrounds are respected and valued here

7) I see strong leadership support of the internship provider's value of diversity and inclusion. People of all cultures and backgrounds are respected and valued here.

28 responses



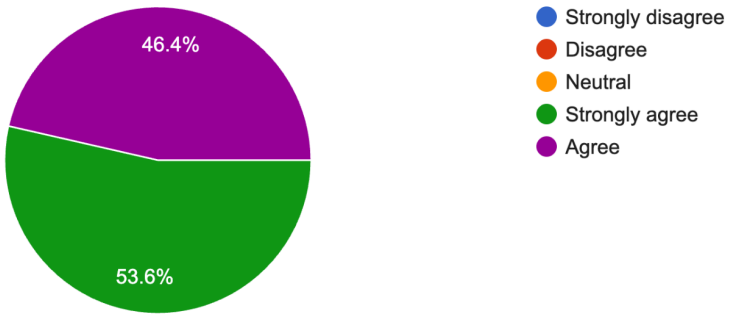
- People of all cultures and backgrounds were respected and valued at Security Metrics. The demographic includes people of color, people of a number of different sexual identities/genders, and people of different backgrounds.
- I felt like it was a very inclusive environment there. Everyone was very friendly and supportive towards me.
- Very welcoming work environment
- It's hard to have diversity in a company based in Utah, but I felt that Pluralsight did a great job at including everyone no matter what person they were.
- The church only accepts people with temple recommends but there is still a fair amount of diversity and they respect everyone
- AT&T has one of the best ratings in DEI/DINE
- The Learning Suite team has had people of different cultures and backgrounds on the team before and I know each of the team members and leaders that support diversity and inclusion.
- The company I worked for hires people from all cultures and backgrounds and encourages diversity. I felt like inclusion was a great topic of conversation there.
- I didn't feel excluded at any point in my internship; however, I didn't get to interact with leadership very much so I can't say that I strongly agree with the statement.
- I always felt respected and that others were respected.
- Several employees are from other countries like India.
- SimpleNexus has people from all kinds of backgrounds and I never felt anyone was discriminatory to any culture.
- Myself being member of a minority, I felt extremely valued for my different background. I always felt included and appreciated. Pluralsight has other diversity initiatives as well that strive to increase diversity in hiring.
- Podium prides themselves on their diversity. For a Utah company, they have a very high percent of minority employees! Everybody is valued equally, and all have a say. It was an incredible experience.
- This is a big priority for the company.
- I feel like the office is pretty inclusive.
- It was a fairly diverse company and everyone had the same opportunities and respect.
- I think this is true about amazon? They are very transparent and support people of all cultures and backgrounds

- My company had people working remotely from the UK, Denmark, the Philippines, Mongolia, and the CEO is a person of color. I feel as if we had a global diverse company which I don't think I would have had from a company here in Utah.
- This was a strong push and there were meetings weekly to help others learn about the cultures and experiences within and outside of the company
- Fidelity has one of the best diversity and inclusion efforts that I have seen from a company. They held all sorts of events, and workshops concerning these matters, and even encouraged all interns to join at least one ERG during our time with Fidelity.
- I was surprised by how much diversity I found there with such a small company. I was working with several people from all around the world including someone from the country Georgia. I got to learn about their cultures and became friends with many people.
- Absolutely. There is an established channel and flow for team member insight and feedback. In addition, honesty and authenticity are expected and encouraged from every team member. Just recently, they instated the Belonging Committee to help in the efforts of inclusion and diversity.
- There was a very diverse team.
- This is a church entity, and as such, the subtle feeling of “exclusivity” is partially unavoidable (prayers before meetings, strange dress code, etc.), but it’s not a big deal. Many employees love that about working here.
- Diversity was prevalent at Apple. The people I worked with were from all over the world, and there was a good spread of men and women across different roles. Many of the interns came from different social, cultural, and ethnic backgrounds. It was inspiring for me to see the broad diversity of people that were employed there. People of all ages, ethnicities, and genders were well represented and respected.
-

I. I have applied what I have learned in different CS classes towards my internship project(s) this semester

8) I have applied what I have learned in different CS classes towards my internship project(s) this semester.

28 responses



- I applied what I could, where I could. The opportunities to apply what I learned were not as prevalent as I would have previously expected before the internship.
- One thing from my CS classes that I learned was how to write tests. I used this knowledge multiple times for different projects. Another thing was the importance of debugging and how to perform it. I used this all the time, and it was a huge help. I had also taken the web development class before, so that was a huge help to me.
- General coding principles helped me in my internship but a lot of the tools I used for the project I worked on were things I had never used before.
- It's hard to take school projects and make them more practical, but I wouldn't have been so successful at this internship if it weren't for my classes. So no, I didn't take specific skills I've learned from school, but I did take a problem solving mindset and the ability to google with me.
- Had to write lots of code that was well-documented, worked with singletons, MVVM, responsive design, etc.
- I learned how to debug in my classes and that is handy because it is mostly what I'm doing. Also it helps to know how to talk about CS
- Principle from CS340/324/260
- I was able to apply the Model-View-Controller model that I learned in CS 340. We use this model for our support web application, so it was a good experience seeing the model implemented in an actual company's codebase. The other concept was backend API structure. We used a new framework, but I was able to recognize certain concepts, such as request and response, that helped me understand the development workflow better.

- CS 235 with data structures, CS 312 with optimizing algorithms, CS 240/260 with good design principles and separating logic in the code.
- I definitely felt like some classes were more applicable than others. CS340 was a class that felt really applicable as well as CS260. There were other classes that didn't feel as applicable, but I felt like my time at BYU has really prepared me to work in a real world scenario.
- CS 260 was a crucial and key class for being able to complete this internship!
- In my CS classes I've mostly just learned C++, but I've applied the way I've learned to approach coding and problem solving to my work here at BYU Broadcasting.
- I used programming skills and concepts as I learned from classes like CS 240, 452, and 224. These were the most useful classes. Not all CS classes I've taken directly helped me in this internship. See my final report for more details.
- I found myself using tons of principles from my CS classes in my projects in my work. For example, I used principles about architecture to design my code and algorithms practiced in class to make my code as efficient as possible.
- I felt this internship was a great practical approach to subjects addressed in three CS courses. CS 240, CS 260, and CS 340. Software architecture was always an important aspect of discussion when coming up with the specifications of a task, and I noticed that I tapped into the concepts learned in CS 340 very often.
- The class that I found the most applicable was CS 260! I learned a lot from that class, and I hope BYU can roll out more web development classes! Many of my other classes prepared me in general ways, but not specifically.
- We used the .NET framework, which is built off of the MVC design pattern.
- I used alot of what i learned in 312 and 340 this internship to make reusable and efficient code.
- Cs 260 was a very helpful class for what I was specifically doing.
- I spent most of my time developing skills in web programming I learned in CS 260, 240 and 324
- If I hadn't have taken CS 240 I wouldn't have been able to do my project at the end of the summer. I used tons of what I learned in 235 as well during my internship.
- Data structures, creating a large application, fundamental concepts
- I applied my knowledge of building a Java server that connects to a database from 240, as well as OOP concepts learned in 142.
- I say the most applicable things were my web development class, knowledge of internet architecture, and design principles for software.

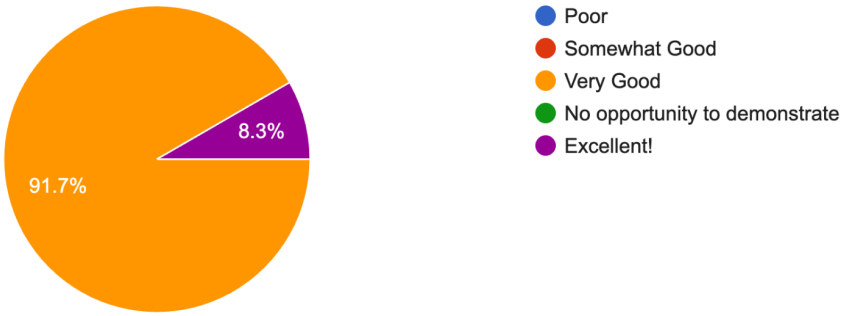
- Yes, I have. I’ve found that for every CS course I’ve taken, I’ve applied at least one principle or understanding while at work. This includes software engineering patterns, practices, and fundamental CS concepts.
- I specifically used what I’ve learned about the structure and design of large applications and the skills I learned in CS 260.
- I took CS 340 and then immediately found an internship that basically applied everything I learned there everyday. Pretty ideal.
- Almost everything I worked on throughout the internship I had been prepared for in some way during school. I had taken classes that touched on software engineering, designing full stack applications, working with web frameworks, building APIs, and writing quality code. All of that and more was applicable to the work I did on a daily basis while building out my full stack application. There was very little I worked with that I hadn't had some kind of exposure to in my course work. It was interesting and validating to see how well prepared school had made me.

Employer Responses

J. Overall Assessment

1. Intern portrayed a high level of commitment and had a positive attitude towards his/her (team) assignment?

12 responses



- <student> has been a joy to work with. He's always positive about work and interacts exceptionally with his peers.
- <student> is always positive and ready to get the job done. He always works diligently on his assigned tasks, regardless of whether they're fun and interesting or boring (but necessary).
- Very easy to work with. Communicates well and was a great addition to the team

- <student> learned quickly and pursued a deep understanding of all the technologies she utilized to complete her project.
    - She used her understanding and new found skills to complete other user interface tasks, after completion of her initial project.
    - <student> demonstrated initiative in pursuing more work after completing her initial project.
    - She showed that she can be independently trusted to complete a feature on her own. She sought help from engineers outside her team to complete her task.
- Here's what her intern buddy (senior engineer) said:
    - Determination, goal oriented, keeps it fun, enjoyable to work with. She stuck with her project, and found bugs and fixed them. Very reliable.
- <student> was an integral part of our team this summer
- <student> has a great attitude regardless of how "fun" the work he's doing is. He is quick to volunteer ideas but also thoughtful in the formulation of ideas in planning and brainstorming sessions and very thorough in everything he has implemented. Constructive feedback is always received very well and rarely if ever will it have to be repeated. He takes ownership of the project in ways that go above and beyond what I would expect from someone with his experience, taking ownership over the entire product through things like monitoring alerts, or finding ways to improve systems and processes related to the product even when those activities don't directly tie into the specific programming task he's been assigned. <student> is also a great team member and a driver of culture and togetherness on the team he's working with making him someone that his teammates enjoy working with. His skills as an engineer were better than expected and he produces thorough, clean, well thought out code. Given his level of experience and where he is at in his progress toward attaining a degree, he has exceeded expectations in every way.
- <student> worked hard, did what I asked and help those around him.
    - He takes the initiative, willing to pick up any task.
- <student> was a great team player. She was 100% committed to every project she worked on and was incredibly easy to work with.
- <student> accomplished so much in his time as an intern at Awardco. To be honest, I always forgot that he was an intern, we pretty much treated him like a full-time engineer.
    - Not only that, but I have seen him grow tremendously during this time. He still has another year of school left but we asked him to stick around and offered him a job!
- <student> has always expressed his excitement and commitment. He does what he says he will and does it on time.
- <student> has had a good influence on his teammates, has consistently demonstrated willingness to help those around him, and performed a variety of tasks without incident. He

has always been happy and willing to do what is asked, and has also contributed meaningfully to areas that the team needed the needle pushed in.

K. Intern's Greatest Strength

- He is able to pick up just about anything I give him and quickly learns new tools to make an impact.
- <student> is very willing and able to adapt. I can give him a complicated assignment and trust he'll figure it out and get it done with minimal need for oversight from me.
- Design and collaboration
- hard worker and technically capable
- Initiative
- Attention to detail, clear communication of difficult concepts, sound technical skill, and courage to challenge the status quo and innovate
- Problem solving
- His greatest strength are Open-minded, Fast learner, and Flexibility
- <student> is a truly talented designer. But one of her greatest strengths is her ability to listen to feedback given by both the client and her team. She used the knowledge she received to make her ideas and the end result better. That is an innate talent, something I believe can't be learned easily. This is what makes a good designer great.
- <student> is very proactive and manages large projects effectively. He's good about following up with people in a very tactful way, orchestrating many moving parts of a project, and never letting something slip through the cracks.
- Running with a project and working hard to complete tasks ahead of schedule and then take on extra stretch projects.
- <student> is very curious, and demonstrates competency and willingness in doing tasks that others view as less 'sexy,' but that are very important.

L. Intern's Greatest Contribution was Demonstrated Through

- Almost right at the start, he was able to jump in and help migrate several of our internal libraries to a private NPM registry, which greatly improved the department's ability to download internal dependencies into various projects. Even without much background experience in our tech stack, he learned very quickly and was able to take a large load off my shoulders.
- <student> has had an immediate positive impact on the BYUTV web client, fixing numerous bugs and adding a few big features, such as the ability to share clips from a video.

- Figma designs and implementation for mobile app, web app etc.
- delivered a UI feature to view events
- Finding ways to improve our product and getting those approved to work on
- Implementation of of a help system for our new product including all application code and design and implementation of CMS
- Progress made on our projects
- His greatest contribution was demonstrated by creating automated tests for existing features.
- <student> is a true designer, she knows her craft. But, she is also a good storyteller. She was able to speak about her ideas with clarity. Part of design is able to back up your visuals with words and she did this well.
- At one point we had a tough deadline and we called on Jake to get it done in time. It was a very difficult task and I know that he put a lot of effort into getting it done on time and he succeeded. He took the lead on the project, including architecting a solution, following best practices while implementing it, managing his progress Kanban-style, working independently to get it done, and collaborating with others to solve problems that reached into other areas of our product.
- contributing to our product - his coding contributions to our team will be useful for both employees and customers
- His attention to improving our Salesforce.com APEX test suite that has been somewhat neglected over time. He was able to independently raise the level of quality that persists through our tests, and bring a larger number of them into compliance with Salesforce best practices, and improve a host more, so that they don't merely function, but rather contribute useful information when they succeed or fail.

M. Areas of Concern

- None.
- When you recognize you've been stuck on a problem or spinning your wheels too long, don't be afraid to reach out for help, even if it means being persistent. As a manager/supervisor, our time is divided between many competing priorities, so sometimes we need the extra reminder or two to shift our focus. The better you are at your job, the easier it becomes to do mine, so there's a vested interest in helping you succeed and giving the attention you deserve!
- I don't have any concerns. <student> is an exceptional, intelligent employee who conducts himself with professionalism and courtesy. He is consistently positive, cheerful, and efficient, and has been great to work with.
- No

- none
- None
- <student> is awesome. We hope he will continue working for us through his schooling and beyond.
- We look forward to working with her.
- I know feedback is important for these interns, and I could write a whole essay about the things that <student> has improved on and still has yet to improve on. However, we have had consistent bi-weekly 1-on-1 meetings to talk about his progress as an engineer, and between those and our daily interactions, I believe he has received a lot of helpful feedback. I have no complaints about Jake's character -- he is helpful, kind, friendly, hard-working, a team-player, and very intelligent on top of it all.
- No areas of concern
- Nothing significant comes to mind. <student> has been great to have on the team.
